# RecallRelay

## Evidence-driven recall response

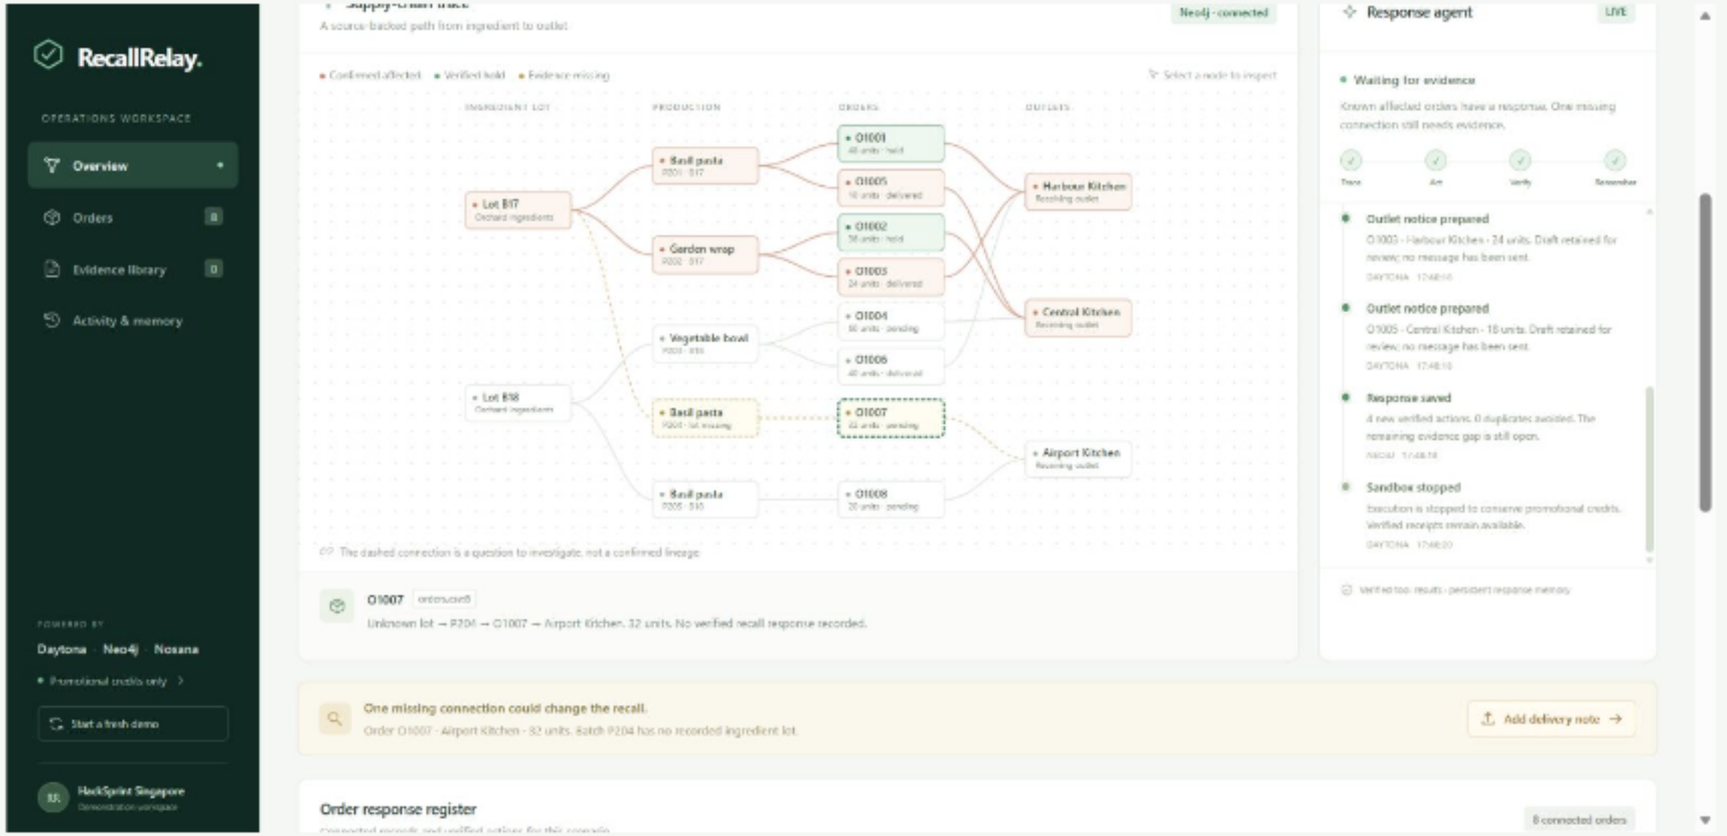

New evidence changes the recall scope.
Verified memory changes the next action.

Daytona HackSprint Singapore
31 October 2026

Functional prototype
Live sponsor services, synthetic order data

# A missing lot number leaves a delivery unresolved

For a central kitchen, one recalled ingredient can affect several products and receiving outlets.

## 32 units

Airport Kitchen

Batch P204 has no ingredient-lot assignment.

The agent retains the evidence gap.

Singapore MSE highlights the need for swift, precise recalls and traceability records.

# New evidence changes the affected network

Delivery note DN-003 confirms that batch P204 used recalled lot B17.

| Observed demo result | Initial trace | After evidence |
| --- | --- | --- |
| Confirmed affected orders | 4 | 5 |
| Units on verified hold | 84 | 116 |
| Unresolved lot connections | 1 | 0 |

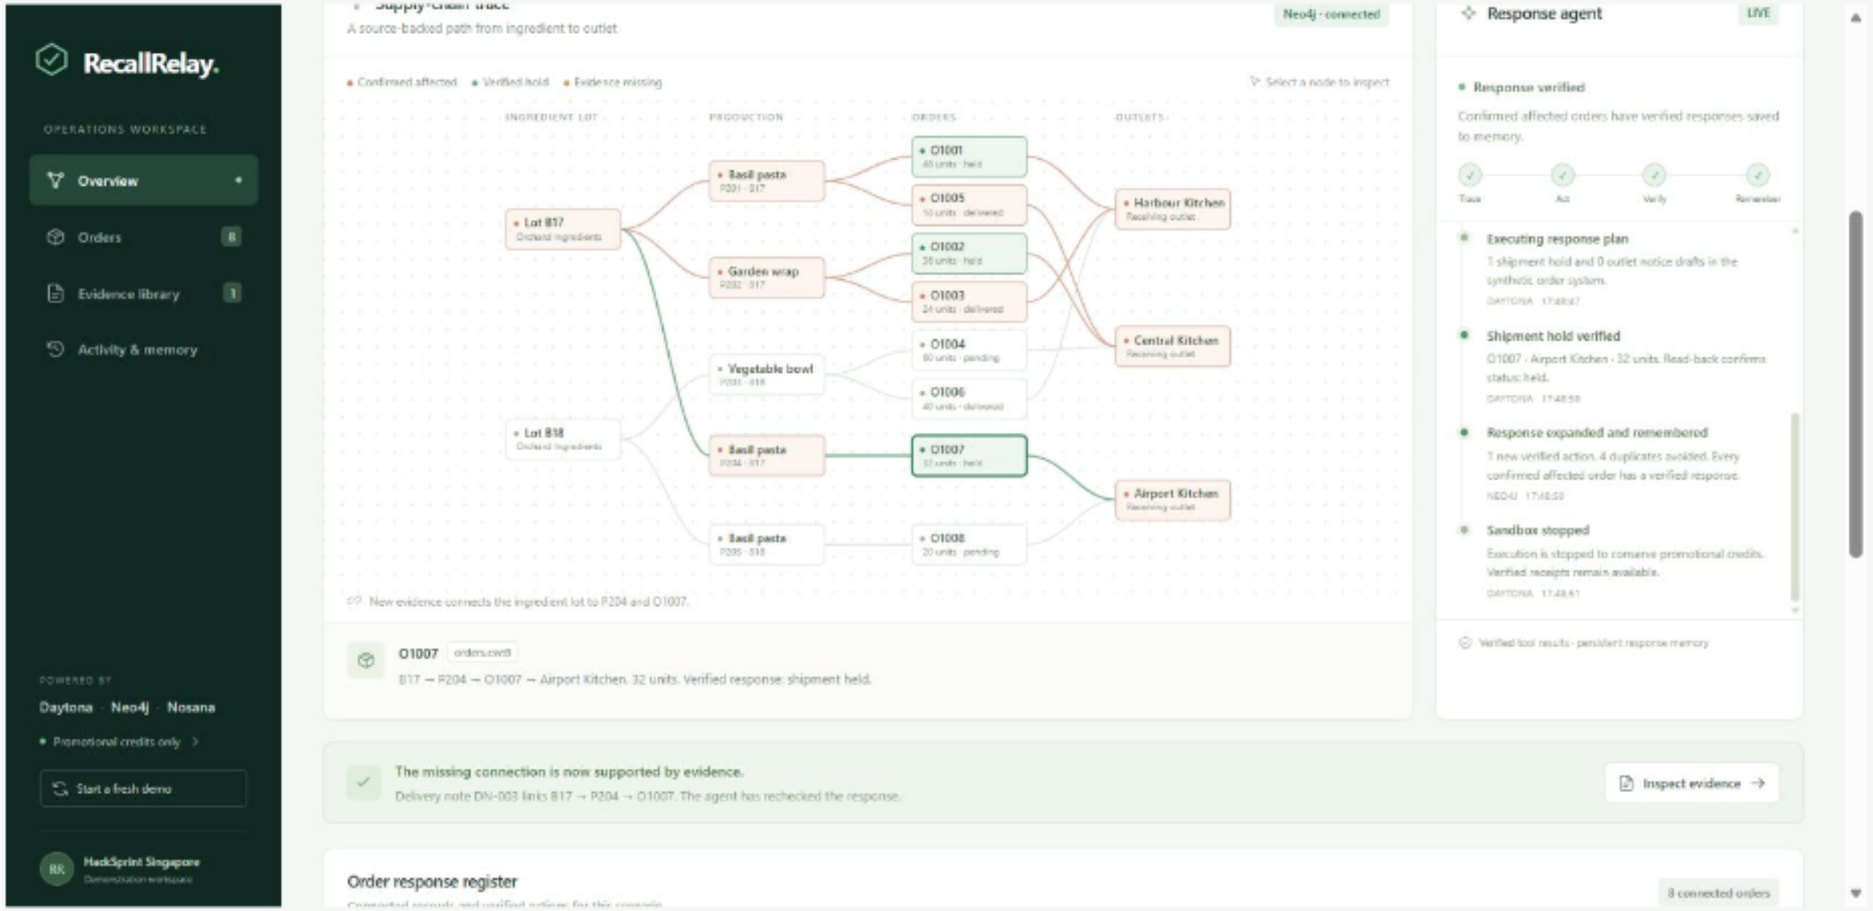

**One additional 32-unit hold. Four previously verified actions reused.**

# Three live services with distinct roles

| Service | Role in the agent loop | Inspectable output |
| --- | --- | --- |
| Nosana | Interprets the source notice and delivery note | Structured identifiers checked against the source |
| Neo4j Aura | Traces relationships and retains response memory | Connected lot, batch, order and outlet paths |
| Daytona | Executes actions in an isolated synthetic order ledger | Read-back receipts confirm shipment holds |

The bounded action policy uses graph context and verified history.

# The new connection triggers only the additional action

**32**

additional units on verified hold

4 earlier actions reused from memory

The new source connects B17 to P204, then to order O1007 and Airport Kitchen.

# Verified results and a repeat run with no duplicates

**5.8s**

to the first verified hold

**0**

new actions on the repeat run

| Final observed result | Value |
|---|---|
| Units on verified hold | 116 |
| Notice drafts for delivered orders | 2 |
| Domain tests passed | 7 |

One fresh synthetic run. Service and network timing varies. No commercial time-saving claim.

# A pilot for central kitchens and food distributors

## Working today

Source inspection and connected recall scope

Verified shipment holds and notice drafts

Persistent response memory and evidence export

## Next pilot

Connect actual production and delivery records

Resolve ambiguous evidence with an operator

Validate against a known recall case

**Every verified response retains its source evidence.**
